

Git & GitHub Setup Guide inside SageMaker JupyterLab

Step-by-step connection for `git@github.com:ShubhamJain17r/Amazon-ML-Hackathon.git`

Git & GitHub Setup Guide inside SageMaker JupyterLab

Repository: `git@github.com:ShubhamJain17r/Amazon-ML-Hackathon.git`

Every team member should run these steps once inside their own SageMaker JupyterLab instance.

Step 1 — Open the Terminal in JupyterLab

1. Open your SageMaker JupyterLab interface.
2. In the top menu, click: **File** → **New** → **Terminal**
3. Verify Git is installed:

```
git --version
```

(You should see `git version 2.x.x`)

Step 2 — Configure Your Git Identity

Set your personal name and the email associated with your GitHub account (each teammate should put their own name and email):

```
git config --global user.name "Your Full Name"
git config --global user.email "your_github_email@example.com"
```

Verify your configuration:

```
git config --global --list
```

Step 3 — Generate an SSH Key inside SageMaker

Run this command in the terminal (replace with your GitHub email):

```
ssh-keygen -t ed25519 -C "your_github_email@example.com"
```

- When prompted: `Enter file in which to save the key (/home/ec2-user/.ssh/id_ed25519):`

👉 **Press Enter** (accept default).

- When prompted: `Enter passphrase (empty for no passphrase):`
👉 **Press Enter twice** (leave empty for seamless git push/pull without password prompts).

Now display your public SSH key:

```
cat ~/.ssh/id_ed25519.pub
```

Copy the entire output line that starts with `ssh-ed25519 ...`.

Step 4 — Add the SSH Key to Your GitHub Account

1. Open GitHub in your web browser: github.com/settings/keys
2. Click the green button: **New SSH key**
3. **Title:** `AWS SageMaker - Amazon ML Challenge`
4. **Key type:** `Authentication Key`
5. **Key:** Paste the copied public key.
6. Click **Add SSH key**.

Verify the connection from your SageMaker terminal:

```
ssh -T git@github.com
```

(Type `yes` if asked about host authenticity).

You should see:

```
Hi <YourUsername>! You've successfully authenticated, but GitHub does not provide  
shell access.
```

Step 5 — Clone the Team Repository

Important: Always navigate to `~/SageMaker` before cloning so your files **persist** across notebook instance stops and restarts!

```
cd ~/SageMaker  
git clone git@github.com:ShubhamJain17r/Amazon-ML-Hackathon.git
```

Move into the repository folder:

```
cd Amazon-ML-Hackathon
```

Verify repository status:

```
git status
```

Output should be:

```
On branch main  
Your branch is up to date with 'origin/main'.
```

```
nothing to commit, working tree clean
```

Step 6 — Daily Team Workflow (Avoiding Conflicts)

1. Before you begin work each day, always pull the latest updates:

```
git pull origin main
```

1. Work strictly inside your designated personal folder:

2. Shubham: `notebooks/Shubham/`

3. Karan: `notebooks/Karan/`

4. Suhani: `notebooks/Suhani/`

5. Vishal: `notebooks/Vishal/`

6. To commit and push your work:

```
git add notebooks/<YourName>/  
git commit -m "feat: added eda and candidate generation tests"  
git push origin main
```

(Large files like `.tsv` and `.parquet` are automatically ignored by `.gitignore` — always keep data stored in S3!)
